To Whom It May Concern

Re: Duranar® & Water Run-Off

PPG Duranar Coil Coatings are composed of 70% Kynar® 500/Hylar® 5000 by weight, a chemically inert fluoropolymer resin similar in composition to Teflon®. To compliment the resin system, Duranar uses high performance inorganic pigments, based primarily on heavy metal compounds, to produce a very durable coating system recognized worldwide for its long-term color fastness and paint film integrity.

It is our belief that a properly applied and cured Duranar finish will not leach out any appreciable amount of harmful substances that could contaminate run-off or ground water. However, we highly recommend the customer consults with his local environmental agency on the specific test requirements and limits of acceptability needed to comply with local and federal laws governing clean water standards. These laws vary widely from region to region.

Thank you for your interest in PPG coatings.

Sincerely,

Gary Altavilla
