- Theoretical section properties for steel panels have been calculated per AISI S100 Specification for the Design of Cold-Formed Steel Structural Members.
- 2. Ixx (eff) values are "effective" stiffness properties for positive (downward) load induced deflection determination.
- 3. S_{xx} values are to be used for flexural (bending) stress determination.
- 4. Charted Load/Span values are based on ASTM E1592-05 (2017) testing protocol.
- 5. Charted Load/Span values above are based on Allowable Stress Design (ASD).....Load Resistance Factor Design (LRFD) technique not recommended for charted values.
- 6. Charted Allowable Uniform Loads are based on the Ultimate Uniform Load (per ASTM E1592-05 testing) divided by a 2.00 Factor-of-Safety.
- 7. Charted Allowable Uniform Loads do not consider panel weight (Dead Load) or clip-to-substrate (structure) fastener connection strength.
- 8. Clip-to-substrate (structure) fastener evaluation and analysis should be performed by a licensed structural engineer.
- 9. Minimum recommended substrate (structure) recommendations:
 - a. Open-framing (i.e. purlins) 16 ga. (design thickness = 0.0566")
 - b. Plywood/OSB 15/32" or thicker is recommended to assure an effective degree of fastener thread engagement
 - c. Metal deck 22 ga. (design thickness = 0.0283")
- 10. Panel tested using 16 ga. High Wind Clip
- 11. Deflection limit consideration for positive (downward) loading is limited to a deflection ratio of L/180 of the span....where "L" is the span in inches.
- 12. Charted Allowable Uniform Loads cannot be increased by 1/3.

				SECTION PROPERTIES							ALLOWABLE UNIFORM LOADS, psf For various support spacings (i.e. span values)									
Width, in.	Gauge	Yield ksi	Weight psf	Top in Compression			Bottom in Compression			Positive Load										
				l _{xx} in ⁴ /ft.	l _{xx (eff)} in ⁴ /ft.	S _{xx} in³/ft	l _{xx} in ⁴ /ft.	l _{xx (eff)} in ⁴ /ft.	S _{xx} in³/ft	1'	2'	3'	4'	5'	6'	7'	8'	9'	10'

- 1. Theoretical section properties for steel panels have been calculated per AISI S100 Specification for the Design of Cold-Formed Steel Structural Members.
- 2. I_{xx (eff)} values are "effective" stiffness properties for positive (downward) load induced deflection determination.
- 3. Allowable load is calculated in accordance with AISI 2012 specifications considering bending, shear, combined bending and shear and deflection.

 Allowable load considers a 3 or more equal span condition.
- 4. S_{xx} values are to be used for flexural (bending) stress determination.
- 5. Allowable load does not address panel weight, fasteners, connection strength or support material.
- 6. Allowable load includes web crippling.
- 7. Panel weight is not considered.
- 8. Load/Span values are based on theoretical computations and not load testing.
- 9. Deflection is not considered.
- 10. Allowable loads do not include a 1/3 stress increase for wind.
- 11. When panels are installed over solid or closely fitted sheathing, the capacity is limited to the capacity of the underlying sheathing.
