- Theoretical section properties for steel panels have been calculated per AISI S100 Specifications for Design of Cold-Formed Steel Structural Members. Intertek N3050.23-301-44 R0
- Charted Load/Span values are based on ASTM E1592-05, divided by a 2.00 Factor-of-Safety.
- Minimum recommended substrate (structure) recommendations:
 - Open-Framing (i.e. purlins) - 16ga (design thickness = 0.0566")
 - Plywood/OSP - 15/32" or thicker is recommended to assure an effective degree of fastener thread engagement.
 - Metal deck - 22ga (design thickness = 0.0283")

- Theoretical section properties for steel panels have been calculated per 2020 AISI S100 North America Specifications for Design of Cold-Formed Steel Structural Members.
- Allowable loads for steel panels are calculated in accordance with 2020 AISI S100 specifications considering bending, shear, combined bending and shear and deflection. Allowable load considers a 3 or more equal span condition.
- When panels are installed over solid or closely fitted sheathing, the capacity is limited to the capacity of the underlying sheathing.

PANEL ATTACHMENT

Fastener Notes:

- When possible, lap panels away from prevailing wind direction.
- 15/32" OSB: #10 Burr Buster fasteners.
- 15/32" Plywood: #10 GP fastener. Screws should be long enough to penetrate through the bottom of the plywood by 3/8".
- Dimensional lumber: #10 GP. Screws should penetrate the lumber 1".
- 16ga (or less) Steel furring: #10 or #12 fastener with DP-1.
- All trim screws used for roof or wall applications should have EPDM sealing washers.
